PROFESSIONAL SUMMARY

Backend engineer with **2.5 years** building and operating production systems end-to-end: payment integrations across Stripe, PayPal, and an in-house gateway; a zero-downtime CRM migration; and an SQS-backed scheduling engine handling **13k+** requests/month. Strong production root-cause record — traced live revenue defects against replica data, quantified their blast radius, and shipped the fixes. Previously technical point of contact for enterprise clients including Uber and HDFC Ergo.

PROFESSIONAL EXPERIENCE

Software Engineer

CodeYoung | Bangalore, India

March 2026 – Present

Lead a zero-downtime CRM migration (Cratio to Arali) across two backend services, designing a config-driven adapter layer that enables dual-write, phased cutover, and instant rollback without a deploy; **135k+** operations synced across **9** flows since rollout.

Own student-reschedule and mentor-substitution flows in Loop, an SQS-backed scheduling engine processing **13k+** requests/month; shipped a deferred cancellation ledger that eliminated a defect charging students twice for a single cancellation.

Re-architected the admin scheduling-requests API from per-mentor rows to request-level grouping — faceted counts, server-driven search, filtering, pagination, and a mentor-eligibility endpoint — validated against live staging data and covered by Jest suites.

Rebuilt the demo reminder pipeline (AI voice calls, WhatsApp, email) as a scheduled-task system with atomic call reservation and deduplication windows, eliminating duplicate outreach across **35k+** reminders/month and making every reminder auditable.

Extended interval-based billing across three payment gateways (Stripe, PayPal, and an in-house gateway), adding custom multi-month PayPal plans and mid-cycle vendor switching that preserves interval metadata to prevent billing drift.

Built a read-only production-replica investigation toolkit — query, schema, and entity-timeline CLIs with incident playbooks — for root-causing live revenue and scheduling defects safely against production data.

Used it to trace a non-atomic webhook race that double-charged customers (**22** recurring cases across **3** gateways since 2022), prove **40%** of AI feedback calls were silently never firing, and surface **95** demo sessions wrongly marked unattended.

Software Engineer

Thriving Springs | Hyderabad, India

February 2024 – February 2026

Served as technical point of contact for enterprise clients including **Uber, HDFC Ergo, and InCred** — diagnosed production issues, coordinated fixes, and supported live feature rollouts in customer environments.

Redesigned MongoDB schemas with index-aware access patterns and consolidated duplicated data paths, cutting average query latency by **15%** and reducing stored-data redundancy.

Designed and owned backend APIs for LMS and OJT workflows in Node.js and FastAPI, powering automated role assignment and skill mapping for **200k+** active users under concurrent access.

Built server-driven filtering, pagination, and RBAC-aware query paths for Angular admin dashboards operating over the full user base, sharply cutting admin data-discovery time on large datasets.

Built asynchronous cron-based email and WhatsApp notification pipelines, decoupling reminder delivery from synchronous workflows and improving task completion rates by **30%**.

Migrated and validated **100k+** production records via staged rollouts, integrity checks, and backward-compatible data contracts with zero data loss; built bulk CSV ingestion with schema validation and partial-failure recovery for **200k+**-user onboarding.

Stabilized API response times under traffic spikes using Redis caching with TTL-driven invalidation; deployed containerized microservices on Docker and Kubernetes in AWS-hosted environments.

TECHNICAL SKILLS

Languages: JavaScript, TypeScript, Java, SQL; working knowledge: Python, C++

Backend & Systems: Node.js (Express.js), Spring Boot, FastAPI, REST APIs, WebSockets, Redis, AWS SQS, Microservices, Async I/O

Databases: MySQL, MongoDB, PostgreSQL, Sequelize ORM, JPA/Hibernate (Schema Design, Indexing, Query Optimization)

Cloud & DevOps: AWS (EC2, S3, SQS, IAM, RDS), Docker, Kubernetes, Linux, Nginx, CI/CD

Frontend: React, Redux Toolkit, Angular, HTML5, CSS3

Observability & Reliability: Loggly, Winston, Sentry, Jest, Production RCA, Incident Investigation

Integrations: Stripe, PayPal, Zoom, WhatsApp Business API, CRM Migration

TECHNICAL PROJECTS

Real-Time Collaborative Kanban Board | Node.js, Express.js, Socket.io, MongoDB, Angular

Designed a WebSocket-based real-time collaboration system supporting **50+** concurrent users with sub-**100ms** event propagation, handling concurrent edits via optimistic locking and conflict-aware updates.

Implemented JWT authentication, indexed MongoDB schemas for low-latency reads, and resilient WebSocket reconnection with automatic state recovery.

Dynamic Form Builder | React (Vite), Java Spring Boot, JPA/Hibernate, SQL

Built a layered Spring Boot backend (Controller–Service–Repository) with a normalized schema separating forms, fields, responses, and response values, enabling arbitrary form composition and scalable response storage.

EDUCATION

B.Tech, Information Technology — Manipal University Jaipur | CGPA: 8.9/10.0

300+ DSA problems solved on LeetCode

October 2020 – July 2024
